

Wind Turbines Could Cause Farmers to Lose the Advantages of Aerial Spraying...

An Ag Pilot Could Lose a Lot More.

Aerial spraying, or “crop dusting,” gets more challenging with every wind turbine project erected on America’s farmland.

Ag pilots have been injured and, sadly, even killed in incidents involving wind turbines and related meteorological towers. The result has been expensive litigation and landowner liability.

Landowners are being asked to make crucial decisions that will impact farmers and their neighbors for years to come. Ag aircraft can treat large areas of land quickly and safely, and may be the only option for treating crops when wet fields, intense insect infestations or dense crop foliage exist. The presence of wind turbines can restrict and, in many cases, eliminate the option of aerial application.

Be sure to consider all the facts before “green lighting” a wind energy installation on your land.
