

Find The 198-Foot Tower.

Now Imagine Finding It While Flying 130 mph.

Pilots of low-flying aircraft can't avoid what they can't see. Unmarked meteorological testing towers for wind power development are a deadly hazard for agricultural pilots, emergency medical helicopters, aerial firefighters and other low-flying aircraft.

These thin, portable towers can pop up without warning, are unlisted on aerial maps, and are

nearly invisible to pilots. Rising just shy of 200 feet, these towers avoid FAA tower marking regulations in most cases.

Let's fix this flaw before it becomes a fatal one. Responsible wind power development should include towers that are properly sited, marked and lit.

Let's Be Fair About Sharing The Air
